## Scan Lines - Paing Shop Pro (PSP) 7 Tutorial

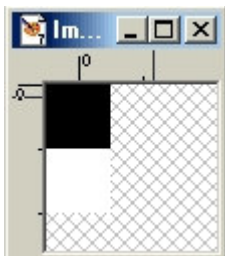

Here is a Paint Shop Pro (PSP) tutorial on how to make those cool scanlines. This tutorial was written for Paint S Pro (PSP) 7, but can probably be used for different versions.

1

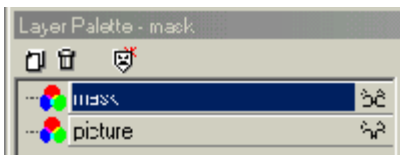

First open the image you want to add scanlines to. Mine is picture of my favorite car.

2

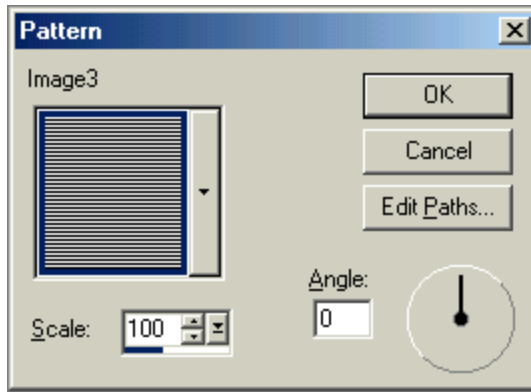

The next step is to create a new image, 1 pixel wide and 2 pixels tall. Using the paint brush  with the brush size of paint the top half black and the bottom half white.

Now create a new layer by going to Layers- New Raster L:

3

 . Name this layer "mask". Select the gradient tool   
select fill with pattern  . Make the pattern source the 1x  
pixel image you just created.

4

Now you need to make the current layer a mask  . Go to  
Masks- New- From Image, and press ok. Now your picture  
should look like this.

5

Now you are done! You can make the opacity scroll bar to  
left in the layers palette to lighten the image. You can also  
vary the size of the pattern image to make the scanlines  
thicker, etc.
